

I used the VS code Copilot to get the code for the button. I also used the code because my employee codes wouldn't show and I learned that I needed to add the same information to all of the entries in order for it to show. I love the xml format, I just hate javascript. I have a very hard time understanding it.

```
<script>
    let employeeTableLoaded = false;

    function toggleEmployeeData() {
        const table = document.getElementById("id");
        const button = document.getElementById("toggleButton");

        if (button.innerText.trim() === "Get Employee Data") {
            if (!employeeTableLoaded) {
                loadXMLDoc();
            }
            table.style.display = "table";
            button.innerText = "Close Employee Data";
        } else {
            table.style.display = "none";
            button.innerText = "Get Employee Data";
        }
    }

    function loadXMLDoc() {
        let xmlhttp = new XMLHttpRequest();
        xmlhttp.onreadystatechange = function () {
            // Request finished and response
            // is ready and Status is "OK"
            if (this.readyState == 4 && this.status == 200) {
                empDetails(this);
            }
        };
    }

```

```
// Request finished and response
```

```
// is ready and Status is "OK"
```

```
if (this.readyState == 4 && this.status == 200) {
```

```
    empDetails(this);
```

```
}
```

```
};
```

```
// employee.xml is the external xml file
```

```
xmlhttp.open("GET", "employee.xml", true);
```

```
xmlhttp.send();
```

```
}
```

```
function empDetails(xml) {
```

```
    let i;
```

```
    let xmlDoc = xml.responseXML;
```

```
    let table =
```

```
        `<tr><th>ID</th><th>Firstname</th><th>Lastname</th>
```

```
        <th>Title</th><th>Division</th>
```

```
        <th>Building</th><th>Room</th>
```

```
        </tr>`;
```

```
    let x = xmlDoc.getElementsByTagName("employee");
```

```
// Start to fetch the data by using TagName
```

```
for (i = 0; i < x.length; i++) {
```

```
    table += "<tr><td>" +
```

```
        x[i].getElementsByTagName("employeeid")[0]
```

```
        .childNodes[0].nodeValue + "</td><td>" +
```

```
        x[i].getElementsByTagName("firstname")[0]
```
